[*] Summary

Overall activity level and project health The repository shows healthy, moderate activity with 20 PRs (many open, a few closed/merged), 19 issues, and only 1 commit in the last 7 days. The low commit count suggests a quiet merge week, but active discussion and contribution via PRs and issue triage indicate ongoing maintenance rather than stagnation. **Main themes and areas of focus** Primary focus areas are video output (vo_gpu_next, vo/opengl, Vulkan/GL formats, HDR/contrast), Lua scripting improvements (console, autoload, ytdl_hook, profiling), and platform-specific fixes (Wayland, macOS, Windows IPC). Several PRs target GPU-next rendering, memory leaks, and async completion, while issues highlight crashes/hangs with Vulkan+hwdec, macOS audio null deref, and streaming playback problems. **Notable changes or patterns** A clear pattern is hardening of the gpu-next/Vulkan path (crash reports like #18270 closed after the libshaderc CI flag removal commit 94335ab, plus decode perf issues). Lua script UX is being refined via async filtering and completion limits. Cross-platform input/IPC and Wayland protocol fixes show steady low-level polish. Closed issues are mostly duplicates or user-error/already-fixed cases. **Summary** mpv saw steady but merge-light activity: 20 PRs and 19 issues with one CI-related commit, reflecting active maintenance and scripting/Vulkan focus. Contributors are improving gpu-next, Lua scripts, and platform support, while recent crashes tie to Vulkan/hwdec and macOS audio. Project health remains stable with responsive triage.
